# INTRODUCTION

## MUTUAL FUND

- **A mutual fund is a type of investment vehicle that pools money from many investors to purchase a diversified portfolio of stocks, bonds, or other securities. It is managed by professional portfolio managers, who make investment decisions on behalf of the investors. Each investor owns shares in the fund, which represent a portion of the holdings. The goal of a mutual fund is to provide investors with diversification and professional management to help reduce risk and achieve investment returns over time.**
- **There are different types of mutual funds, including equity funds (focused on stocks), bond funds (focused on bonds), index funds (designed to track market indexes), and balanced funds (which combine stocks and bonds). The value of the mutual fund's shares rises or falls based on the performance of its underlying assets.**
- **Mutual funds are considered an accessible way for individual investors to participate in the stock market, especially for those with limited time or expertise to manage their own investments.**

# IMPACT OF MARKET FLUCTUATIONS ON MUTUAL FUND

**STOCK FUNDS**

**BALANCE FUND**

**BOND FUND**

mutual

fund

- **Mutual funds are significantly affected by market fluctuations, as they are essentially pools of investments that can include stocks, bonds, and other securities. The extent to which a mutual fund is impacted by market fluctuations depends on several factors such as the type of fund, the underlying assets, and the broader economic environment. Here's a deeper analysis of how market fluctuations affect mutual funds and how investors can manage volatility:**
